1. January changes

GET /health was simplified to basic API-process checks. Deep dependency state moved to GET /services. A green health response no longer implies every route works.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

Troubleshooting note

- Do not infer unrelated feature changes.
- Compare event time with the change date.
- Keep old logs as they were recorded.

Example

If an old incident contains a generic error that now has a specific code, use the old record to understand history but do not expect the modern code to appear before it existed.

Content note

The change log helps explain differences between snapshots and incidents. It does not override current service status or current configuration.

Why this matters during incidents

Operational behavior changes over time. A log code, health response, or validation rule that exists today may not have existed in an older incident. Compare the event date with the change log before treating differences as inconsistent evidence.

A release note can explain why an older postmortem uses a generic code while current logs use a more specific code. It should not be used to override the actual current status or configuration.

Review points

- Was the incident before or after the change?
- Did the change affect the same service?
- Did it alter code meaning, health behavior, or only display wording?
- Does current evidence match the new behavior?

Keep version differences in mind when reusing old troubleshooting notes, especially for error mapping and service-health interpretation.

2. February changes

Orders added ORD-409 MIGRATION_MISMATCH so schema failures can be distinguished from database-open failures.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

3. March changes

Tracking added a partial-data flag for TRK-206 so available events can be returned without pretending the history is complete.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

4. April changes

Carrier snapshots added `last_updated` and `status` fields. Staleness is evaluated from the timestamp.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

5. May changes

Documents separated DOC-403 permission errors from DOC-500 invalid-store configuration.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

6. June changes

Notification status added queue depth and oldest pending age. NTF-429 now represents backlog conditions more clearly.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

Troubleshooting note

Keep version differences in mind when reusing old troubleshooting notes, especially for error mapping and service-health interpretation.

7. July changes

Reporting added MAX_REPORT_DAYS validation. Oversized ranges return RPT-422 before query execution.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

Troubleshooting note

- Do not infer unrelated feature changes.
- Compare event time with the change date.
- Keep old logs as they were recorded.

Keep version differences in mind when reusing old troubleshooting notes, especially for error mapping and service-health interpretation.

8. August changes

Request IDs were added to most API and downstream logs for correlation.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

Troubleshooting note

- Do not infer unrelated feature changes.
- Compare event time with the change date.
- Keep old logs as they were recorded.

9. September changes

Configuration snapshots began masking secret values by default.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

Troubleshooting note

- Do not infer unrelated feature changes.
- Compare event time with the change date.
- Keep old logs as they were recorded.

Keep version differences in mind when reusing old troubleshooting notes, especially for error mapping and service-health interpretation.

10. October changes

Orders health checks began distinguishing missing path, missing file, unreadable file, and schema mismatch.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

Troubleshooting note

- Do not infer unrelated feature changes.
- Compare event time with the change date.
- Keep old logs as they were recorded.

- Does current evidence match the new behavior?

Keep version differences in mind when reusing old troubleshooting notes, especially for error mapping and service-health interpretation.

11. November changes

Degraded service status added a short reason field. The reason is a summary and should be confirmed with logs.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

Troubleshooting note

- Do not infer unrelated feature changes.
- Compare event time with the change date.
- Keep old logs as they were recorded.

- Does current evidence match the new behavior?

Keep version differences in mind when reusing old troubleshooting notes, especially for error mapping and service-health interpretation.

12. December changes

Incident notes added a structured unknowns field so unresolved questions are kept separate from the current conclusion.

Operational effect

Older incident records may show less specific codes or different health wording. Use the current reference for present behavior while reading historical evidence in its original context.

Troubleshooting note

- Do not infer unrelated feature changes.
- Compare event time with the change date.
- Keep old logs as they were recorded.
